ACIDITY REGIMEN OF POSTMAGMATIC SOLUTIONS
(Rezhim Kislotnosti Poslemagmaticheskikh Rastvorov)
tr. by Ivan Mittin. 1963 [27p] 11 refs
Order from OTS or SLA \$2.60

63-23601

Trans. of Akademiya Nauk SSSR. Izvestiya. Seriya
Geologicheskaya, 1957 [v. 22] no. 12, p. 3-12.

DESCRIPTORS: *Geochemistry, *Igneous rock, Rock
(Geology), *Fused materials, Solutions, Granite,
Phase studies, Hydrogen ion concentration, Activity
coefficient

Regardless of the temperature conditions of their formation, the post-magmatic mineral deposits always reveal phases of increasing and then decreasing acidity of solutions. The article discusses possible causes of such a regimen. A probable cause is the faster filtration of certain acidic components of the solution causing (Earth Sciences--Geology, 'IT, v. 10, no. 12) (over)

II. Geological Survey,
Denver, Colo.

63-23601

Office of Technical Services

an "advancing wave" of stronger acidity in the percolating flow, which explains the increase and the subsequent decrease in acidity of each given cross-section of the flow. It is demonstrated analytically that, with increasing acidity of the solution, the degree of ionization rises more rapidly in bivalent and particularly trivalent bases than in monovalent bases. Therefore, the post-magmatic acid phase must have different effects on basic and alkaline rocks than on rocks of acidic composition. Particularly, the pyrrhotitic and titanomagnetite metallization in gabbroic and ultrabasic rocks, and the formation of carbonatites in alkaline massifs, may be considered as manifestations of the acid phase of a post-magmatic process in the medium of basic and alkaline rocks, respectively.
